The effect section of Godfazer Cracked Version is where we will start. The first thing to notice is the 25 different filter variations. Each has a narrow or wide filter, two types of resonance (low pass, band pass, high pass), and a static or variable resonance. The 22 total effects are also located here; the band pass filter, band split, notch filter, Q and the combined band split and notch filter can be used individually, or with one of the others. Another way to use the effects is through the modulator section. The two modulation blocks available in this section are the amplitude modulator and the phaser. There are also some LFOs, a release and a step sequencer. You can use them all, or you can choose between a few of them. If you're using the presets, it's probably a good idea to work through them before diving into this section. The chorus effect comes in three versions: classic, phaser and ring modulator. The only difference between the classic and phaser version is the rate (slow or fast); ring modulator is very different. It can be heard at the end of most radio songs, and it's the only effect that can be triggered with a MIDI controller. Ring modulator has a lot of parameters to set, and to achieve something like it you might want to go to the presets and then tweak them. What's New in the Godfazer?

Godfazer is a modern take on the classic LFO effect, so it can be used in a variety of musical contexts. The LFO is modulated by the LFO input and can be ramped from 0 to 500, where it operates more like an envelope generator, but has a square wave output. It can also be turned off completely and is always self-modulating. The LFO rate, depth, and slope can be controlled with LFO sweep controls. Routing control is provided through the Routing (two-level) section, which offers basic channel and mix routing. There are 21 channels where you can route each of the output stages of each of the 20 effects. Channels 1-10 can be routed to the Master 1/2/3, channels 11-20 to Master 4/5, and channels 21-22 to the Master Output. There is also a dry/wet control for each effect. Modulators are included in the Reverb, Delay, Chorus, and X-Pad sections, and are all 16-stage modulation sources with access to the modulation output. The modulation is activated by the Modulator Control and access to the modulation-out sections is provided via the Buss Routing (two-level) section. The Modulators in the Reverb section can be assigned to any of the Routing controls in the Godfazer. There is an FX/Time section which features a range of filters and delays, including a high-pass, band-pass, low-pass, high-pass, band-pass, shelving, notch, and comb, as well as an LFO and time scale effect. There is a V/Oct option which can be set to any of the available modulation routings, an LFO, and a sweep-able filter. The Cello section features a high-pass, band-pass, low-pass, and notch filter, as well as a delay, LFO, and sweepable filter. The X-Pad section features a delay, LFO, sweepable filter, and envelopes. The Ensemble section features an Auto Pan, a Tremolo, a Multimode, an Auto Pan/Tremolo with True Shape Envelope, an Auto Pan, an Auto Pan with True Shape Envelope, an Auto Pan/Tremolo, a Tremolo with True Shape Envelope, an Auto Pan/Tremolo/Chorus with True Shape Envelope, a Chorus with True Shape Envelope, a Chorus, an Echo, a Tape Reverb, a Flanger, a Comp, a Chorus/Comp with True Shape Envelope, a Comp, and a Reverb.
