KeyMacro is a Mac OS X helper application that allows you to type LaTeX, TeX or any other text macro without using any external editor. It is similar to the functionality of TextExpander, it generates text macros for the user and stores them on a server. Languages: TextMate, Texmaker, Vim, Emacs, TextWrangler and any other text editor supported by KeyMacro. Note: some of the text macros are selected for TeX and some for LaTeX. The behavior is the same for all LaTeX packages: Macros are defined as environment variables (and thereby, in turn, as environment variables for the environment they are defined in) and can be passed to the document in a `\catcode\^^M=12 \catcode\^^I=11` way. Supported LaTeX/TeX packages: `\documentclass \begin{document} \end{document} \end` Some text that is not a macro. `\bye` No login or information is required. It will work with documents saved with all of the abovementioned text editors. The generated text macro files are plain text files (no binary extension), but they are saved in the current directory and given a.kmm extension. The name of the macro file is automatically generated and is constructed from the environment in which the macro is defined. Please note that some macros, especially those defined in the LaTeX environment, depend on having all the standard LaTeX files, i.e., for example, that the pdftex package is already installed. If a macro is not found (and a filename does not exist in the current directory), a warning is displayed. Maintained by Ilker Erkan. The KeyMacro project is licensed under the GPLv3. Modified: 2010-03-27 Modifications: 2010-07-27 Source code control: SourceForge, Platforms: Mac OS X (10.6+), GNU/Linux (native binaries for Debian/Ubuntu, source for other distributions), Windows 2000, XP, Vista, 7 (native binaries for Vista), Solaris, and iOS (iPhone/iPad). Each system has its own advantages and disadvantages. The current version works with Apple's systems since 10.3. 4 1d6a3396d6

It may seem like a sweet treat, but eating sprinkles is much more than sprinkling some sugar on top of your ice cream or cake. It's also bad for your heart. Sprinkles and other icing are typically made with food coloring, propylene glycol, and food preservatives. This means that, unlike most other food, sprinkles contain many chemicals. This doesn't mean you shouldn't eat sprinkles. But it does mean that you should consider the health implications of eating them, along with a healthy diet. Why Sprinkles Are Bad for You Sprinkles are often made with food colorings, food preservatives, and propylene glycol, all of which are chemicals. These chemicals may lead to health issues, especially if you're eating them on a regular basis. Some of the chemicals that are in sprinkles include the following: B-naphthol Hexamethylenetetramine Red 2 Lake Red 40 Lake Xylitol Propylene glycol Propylene glycol is a sugar alcohol that is used as a food additive, as well as in medicines and cosmetics. The FDA banned propylene glycol as an additive in food and drink because it has the potential to cause a medical condition called osmotic diuresis. This occurs when the kidneys are forced to eliminate water, which leads to water intoxication. This can cause serious health problems such as shortness of breath, mental confusion, and seizures. Eating sprinkles that contain propylene glycol could lead to this condition. Furthermore, propylene glycol and other chemicals in sprinkles may cause liver and kidney damage. The sprinkles industry uses ingredients like butylated hydroxytoluene (BHT), butylated hydroxytoluene (BHA), and propyl gallate to prevent the breakdown of the chemicals in the food coloring and icing. These
